

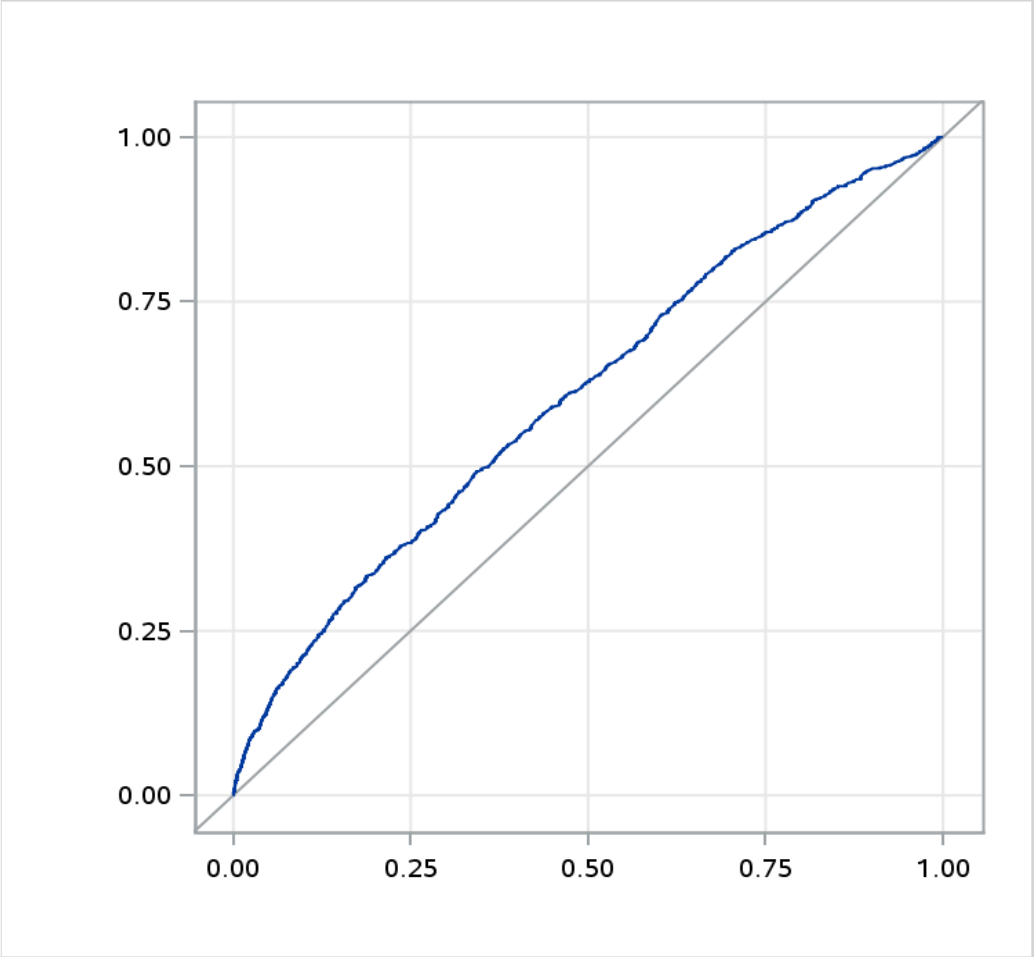

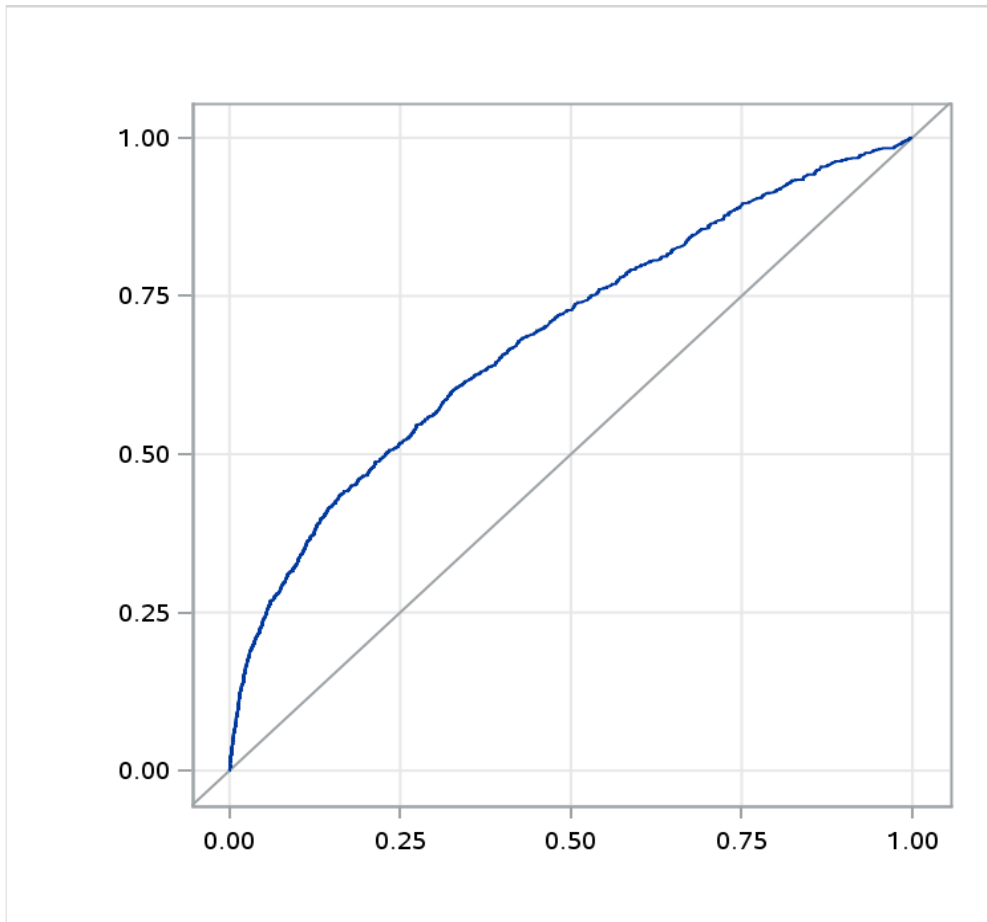

Figure 2. Receiver operator curve showing the discrimination of the clinical prediction model for **maternal end-organ injury or death** arising between 20 weeks' gestation and 42 days after birth using variables measured in the index pregnancy prior to 20 weeks' gestation (**2a**); the index pregnancy prior to 20 weeks' gestation and pre-pregnancy (**2b**); the index pregnancy prior to 20 weeks' gestation, pre-pregnancy, and in a previous pregnancy (**2c**). Analysed is the cohort of 333,435 births among parous women.

2a.

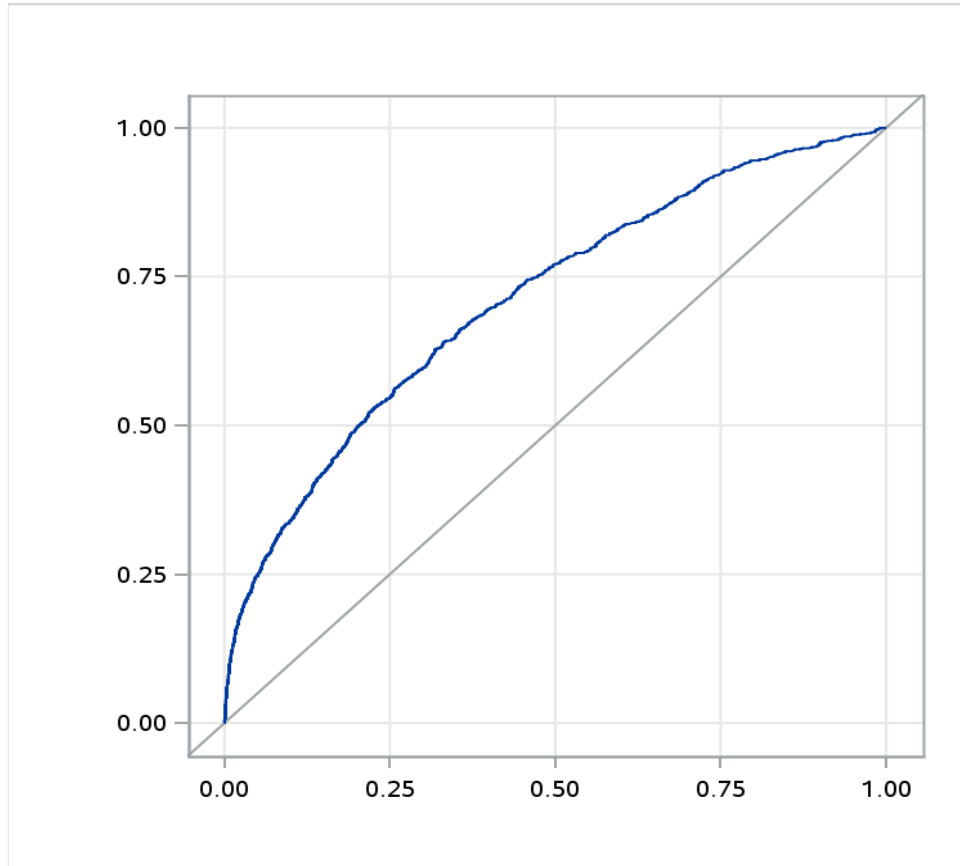

C-statistic for Area Under the Curve = 0.61 (95% CI 0.59-0.63)

2b.

C-statistic for Area Under the Curve = 0.69 (95% CI 0.67-0.70)

2c.

C-statistic for Area Under the Curve = 0.71 (95% CI 0.69-0.73)
